Professor manual

Creating and scheduling exams, adding questions, enrolling students, monitoring the exam and reviewing results

Version 1.3 · October 2026

Ajou University in Tashkent · AUT Secure Exam

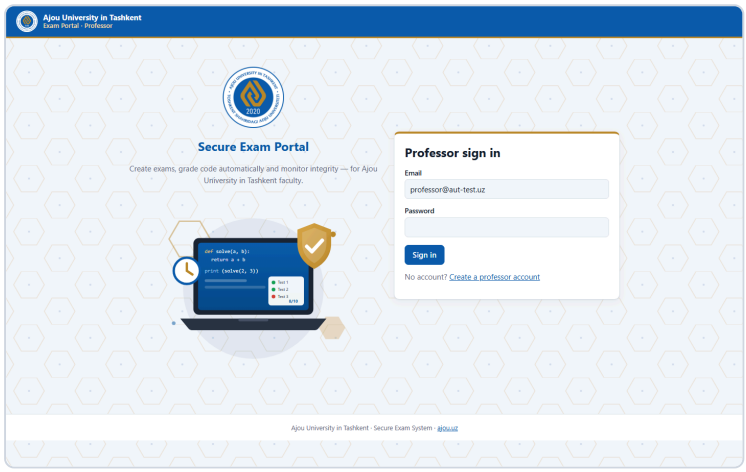

> The professor portal is at **https://exam.ajou.uz** (also from the home screen of the Windows and Android apps: *Teacher / Professor portal*). Section 9 is a checklist for exam day.

Contents

1. Your account
2. The exam list
3. Create and schedule an exam
4. Add questions
5. Publish and enrol students
6. During the exam: live monitor
7. Marking and results
8. English tasks (IELTS)
9. Exam-day checklist
10. Troubleshooting

1. Your account

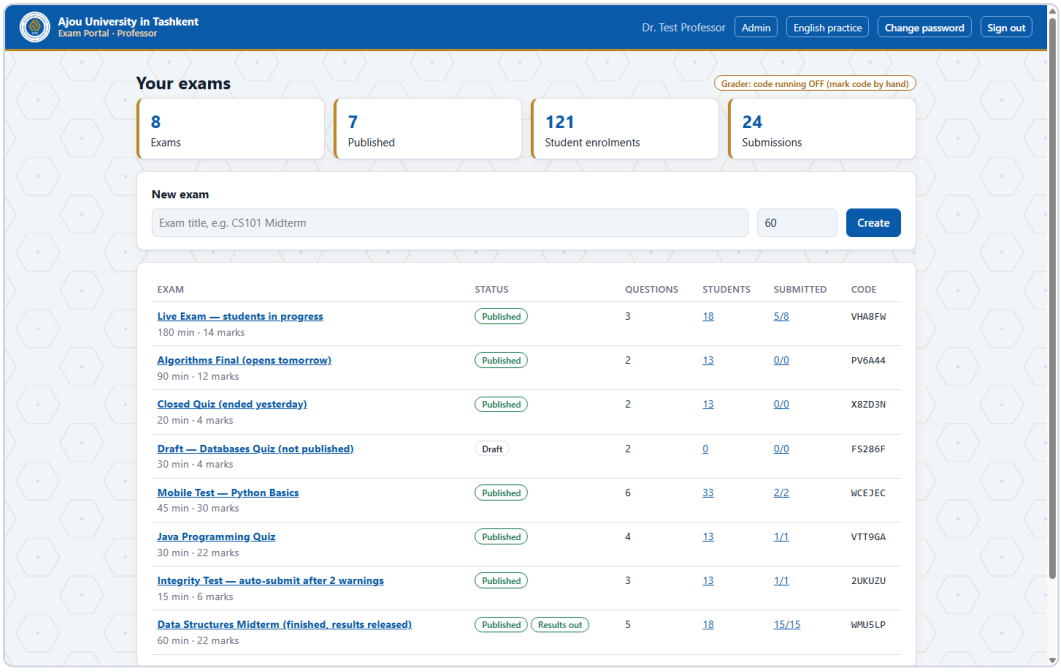

Professor accounts are created by the administrator, or with the professor signup code the administrator gives you (**Create a professor account** on the sign-in page). Sign in with your university email and password.

Professor sign-in

- **Change password** (top right) ends your sessions on all other devices.
- After 10 wrong passwords the account is locked for 15 minutes. The administrator can reset your password.
- Always **Sign out** on shared computers.

2. The exam list

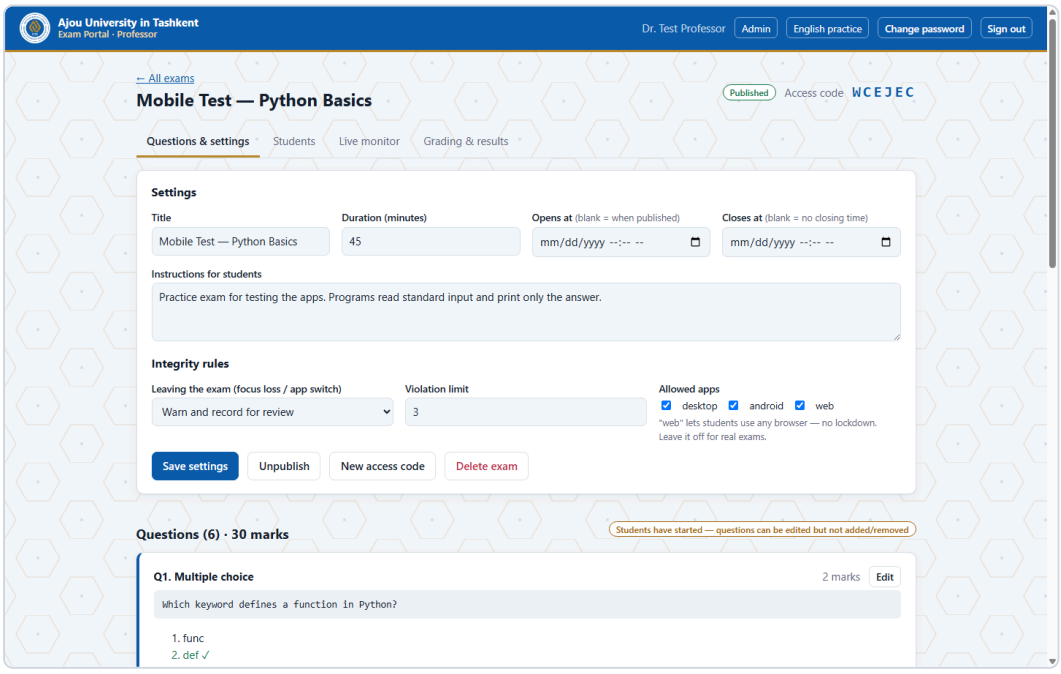

Your exams: totals, the code-marking status (top right) and one row per exam

Each row shows the exam's status, access code, enrolled students and submissions. Click an exam to open its tabs: **Settings & questions**, **Students**, **Live monitor** and **Results**. The pill at the top right shows whether programming answers are marked automatically (*Judge0 connected*) or must be marked by hand.

3. Create and schedule an exam

1. Type a title under **New exam** and click **Create**.
2. Fill in the settings and click **Save settings**:

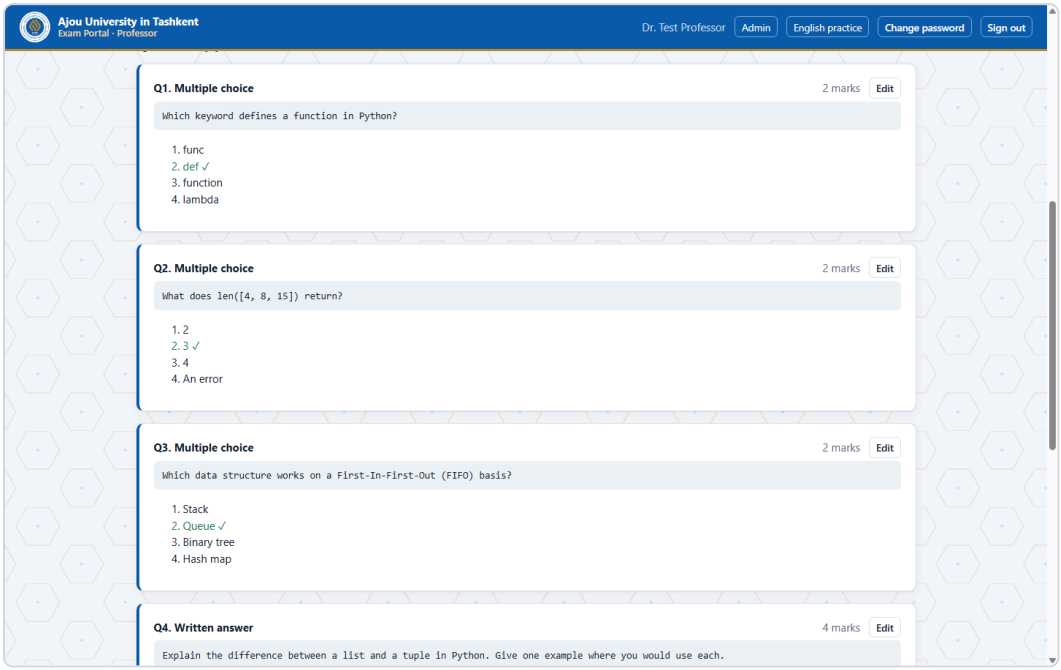

Exam settings

Setting	Meaning
Duration (minutes)	Time each student has after pressing Start. The timer runs on the server.
Opens at / Closes at	The exam window (scheduling). Students cannot start before it opens; nobody can work after it closes. Leave empty to open as soon as it is published.
Instructions for students	Shown before the student starts.
Allowed apps	Windows (desktop), Android, Web. For high-stakes exams allow only the apps with lockdown.
Violation limit and action	*Warn and record for review*, or *Auto-submit after the limit* (for example after 3 warnings).
Access code / New access code	Students join with it. Generate a new one if it leaked.

> A student who starts 10 minutes before the closing time gets only those 10 minutes: the deadline is the earlier of *start + duration* and *Closes at*.

4. Add questions

Under **Questions** choose **Multiple choice**, **Written answer** or **Programming**, fill in the form and click **Save question**. Questions cannot be changed after the first student has started (they are locked).

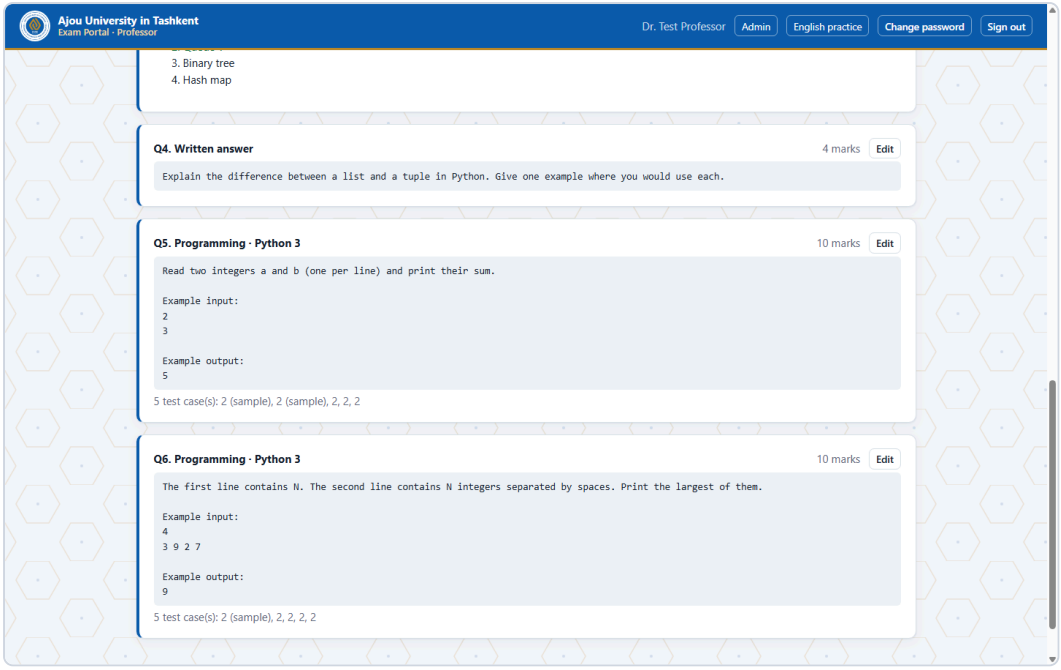

The question list of an exam

Type	How it is marked
Multiple choice	Automatically, when the student submits.
Written answer	By you, on the Results tab (marks and feedback).
Programming (Python 3, Java, C++)	Automatically by test cases (with Judge0 on the server), or by you when code running is turned off.

Programming questions

1. Write the task, choose the language, optionally give **starter code** and a time limit per test.
2. Add **test cases**: input, expected output and marks. Tick *sample* for tests the students may see and run; the others are hidden and used only for marking.
3. Paste a correct solution under *Check a reference solution* and click **Run all tests**: every test should pass.

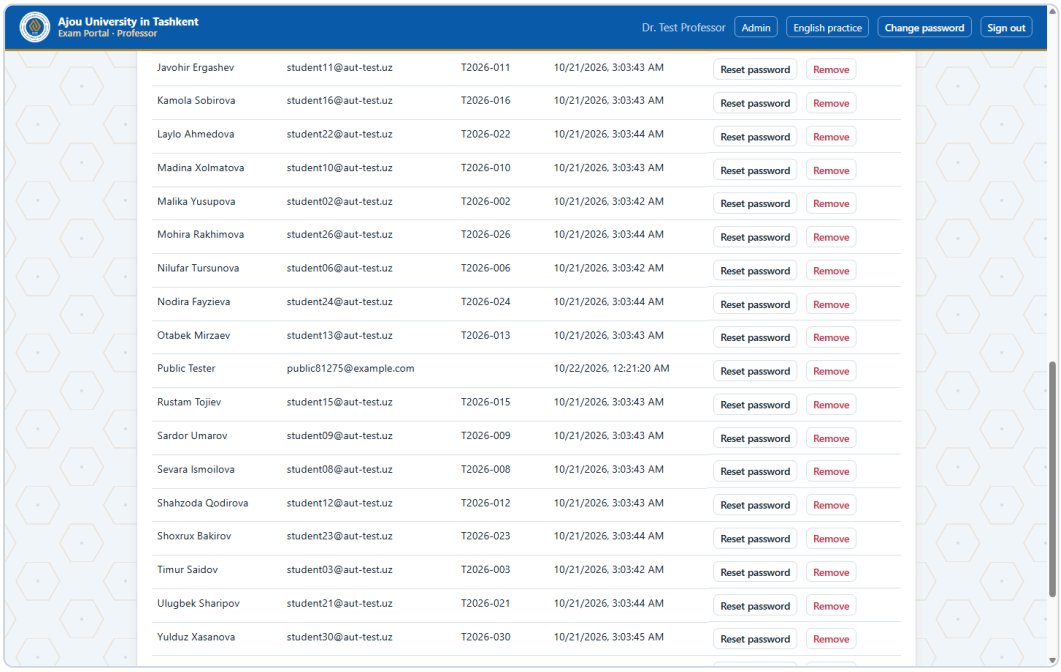

A programming question with test cases

> Example: 10 marks, 5 tests × 2 marks. A program that passes 4 tests gets **8 / 10**. Output is compared after ignoring trailing spaces and blank lines.

5. Publish and enrol students

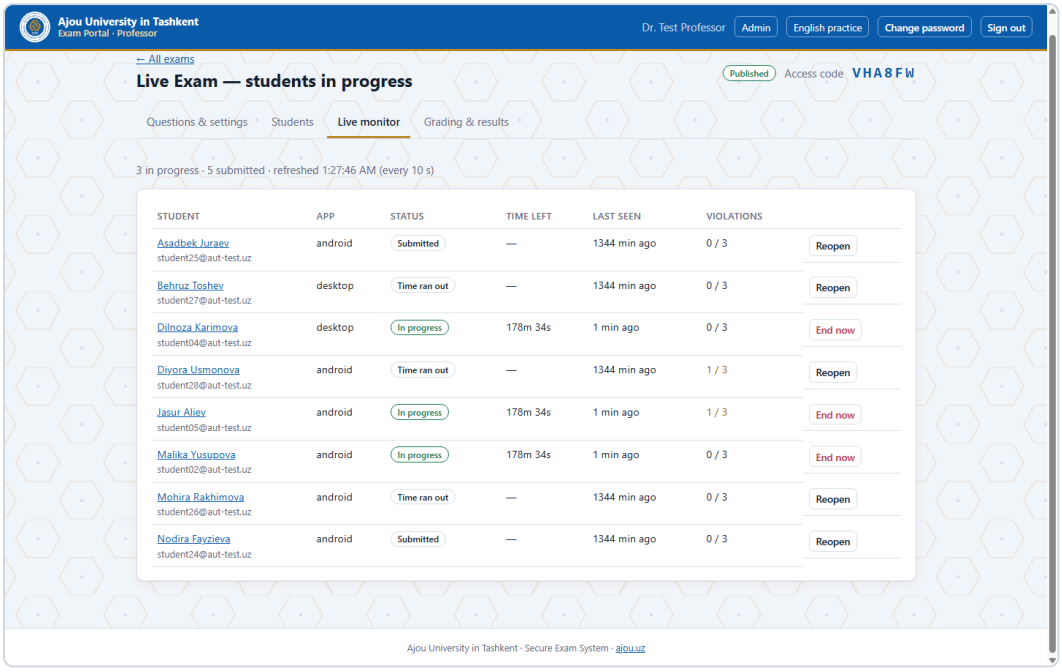

1. Click **Publish** on the Settings tab. Unpublished exams are invisible to students.
2. Give students the **access code**, or add them on the **Students** tab: one per line `name, email, student number, initial password` (existing accounts need only the email), then **Add & enrol**.

Students tab: access code, adding students, enrolled list with Reset password

On this tab you can also **Reset password** for an enrolled student (their other sessions are ended) or **Remove** them.

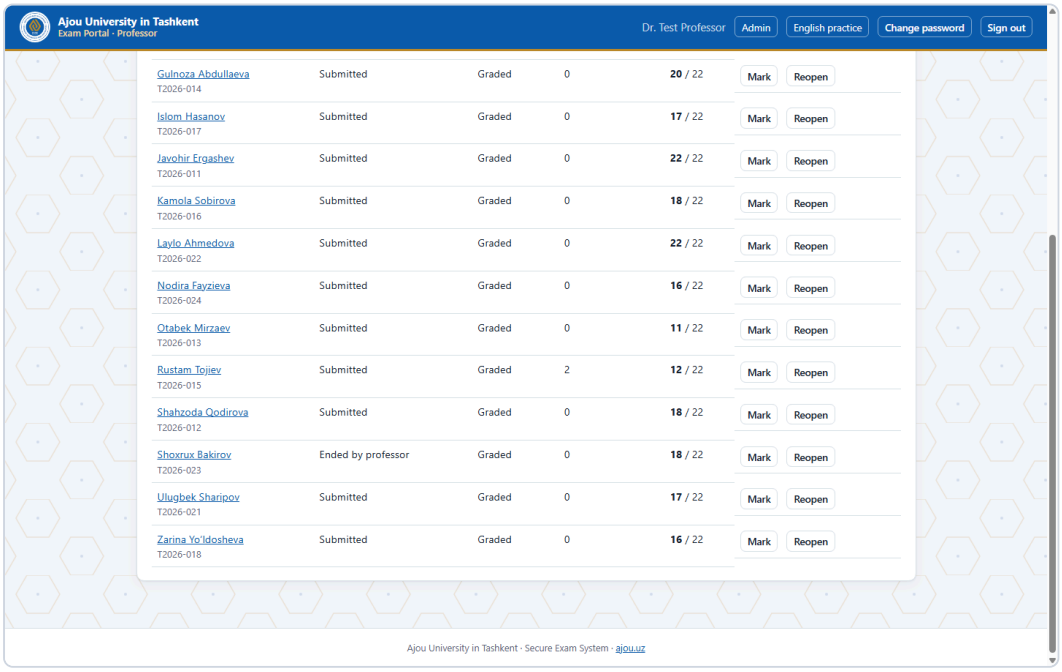

6. During the exam: live monitor

Live monitor: every student, time left, last activity and integrity warnings

- The table refreshes every 10 seconds: status, time left, *last seen* (a student not seen for minutes may have lost the connection) and the number of **violations**, with details (left the app, unpinned, blocked paste…).
- **End now** submits a student's exam immediately (for example after cheating is confirmed).
- **Reopen** (after submission) lets a student continue with all saved answers and **extra minutes**, optionally resetting the violation counter: use it after a crash, a power cut or an unfair auto-submit.

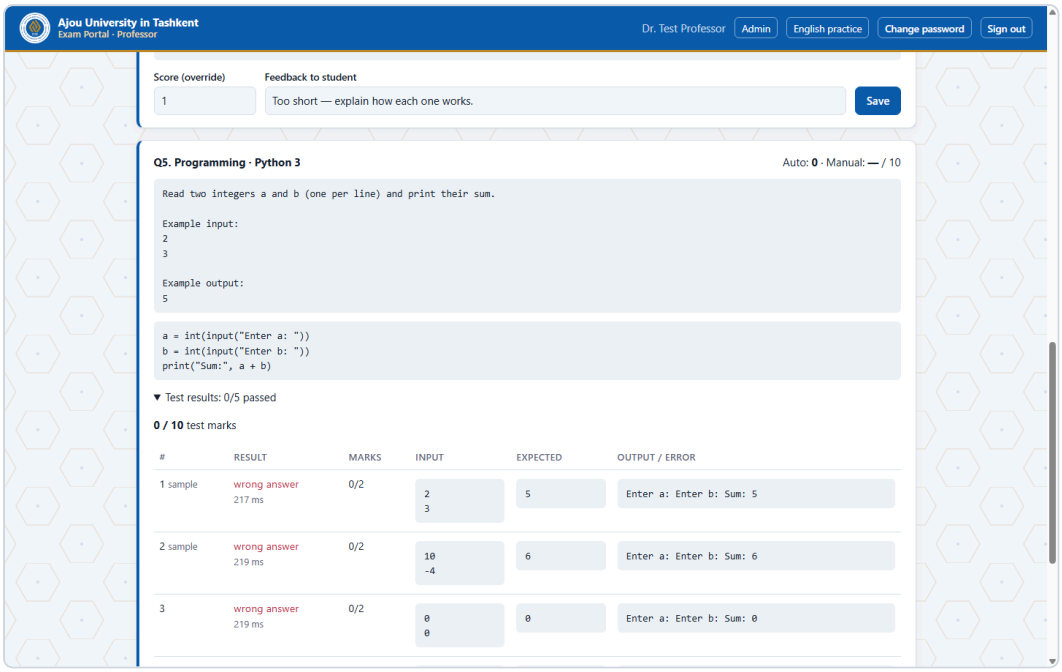

7. Marking and results

Results: score per student, grading status, Download CSV and Release results

1. Multiple choice and programming answers are marked automatically after submission (*Queued* → *Grading* → *Done*).

2. Attempts with written answers show **Needs review**: click **Mark**, enter marks and feedback for each answer.
3. If code marking failed (*Grader error*, for example Judge0 was down), click **Re-run auto-grading** when it is back. Nobody is silently given 0.
4. **Download CSV** exports all scores for your records.
5. When everything is marked, click **Release results to students**. Students then see **View result**.

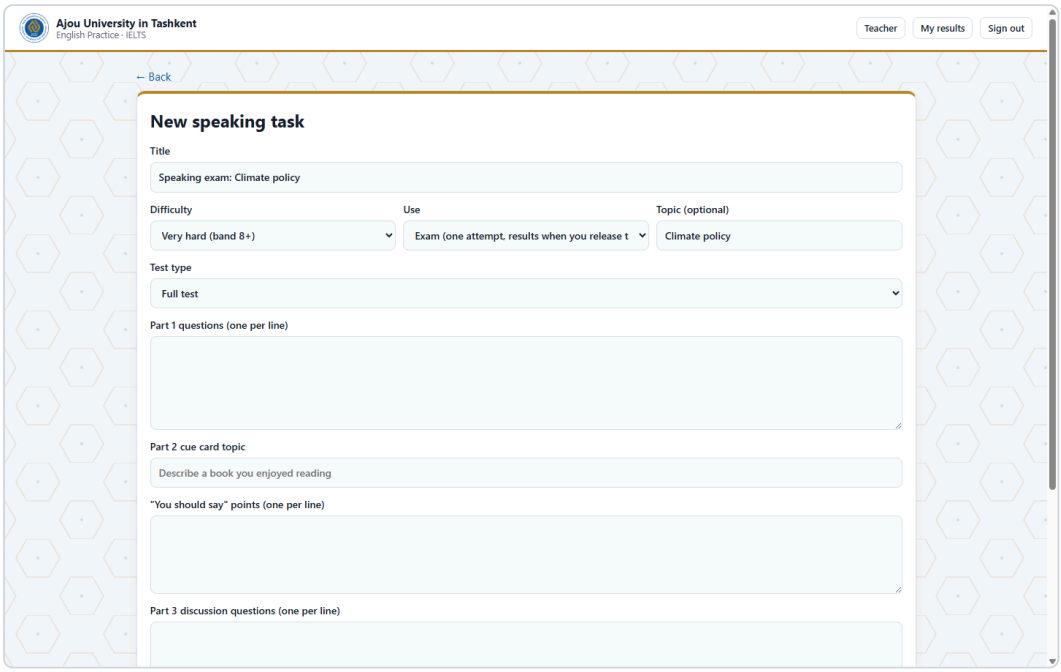

Marking one attempt: answers, test results, marks and feedback

8. English tasks (IELTS)

Top bar → **English practice** → **Create a task**. For every speaking, writing, reading or listening task choose:

- **Difficulty**: Standard (about band 5–6.5), Hard (band 7+), Very hard (band 8+). Use Hard and Very hard for difficult topics.
- **Use**: Practice (instant band, unlimited attempts) or **Exam** (one attempt, the listening plays once, results hidden until you click **Release results**).
- **Topic** (optional), and *Publish in the public library* to share it with every student.

A new very hard speaking exam task

Give students the task code (for example `EN52G5C`). On the task's results page you can listen to recordings, read essays, set your own band and feedback, and re-score with the AI examiner.

9. Exam-day checklist

☐ The day before: questions checked, programming tests pass with *Run all tests*, exam **published**, opening and closing times correct
☐ Students have the app installed and signed in once (ask them to try the practice exam)
☐ Tell students: Do Not Disturb on, charger ready, tap **Got it** on Android
☐ During the exam: keep the **Live monitor** open; watch *last seen* and violations
☐ Problems: **Reopen** with extra minutes rather than restarting
☐ After the exam: mark written answers, check *Grader error*, **Download CSV**, then **Release results**

10. Troubleshooting

Problem	Solution
Students do not see the exam	Is it **published**? Have they joined with the access code? Is it within *Opens at / Closes at*?
"This exam must be taken in the … app"	Change **Allowed apps** in Settings, or tell students which app to use.
Cannot edit questions	Locked because a student has started. Create a new exam for changes.
Programming answers show "needs review"	Code marking is off or Judge0 is unreachable: mark by hand or **Re-run auto-grading** later.
A student's app crashed	The student signs in again and taps **Resume**. If already auto-submitted: **Reopen** with extra minutes.
A student forgot the password	**Students** tab → **Reset password**, or ask the administrator.
Many violations from one student	Open the attempt to see each event and its time. Discuss before deciding.
